

Architectural models are a small scale representation of a true building form. They bring out a buildings' real features i.e. form, proportion, appearance, texture and its relationship with its immediate context such as landforms and existing buildings.

Models can be categorized into three (3) basic types:

- **Conceptual Massing Models** : are primarily used for design study/exploration (as sketch models) and for master planning purposes hence are not detailed
- **Fixed Models**: are scaled and detailed models capturing the exterior form and features of a building and its immediate context
- **Demountable Models**: are detailed models that are openable (normally the roof/individual floor levels) to reveal further details of the interior spaces of the building

### Gum Manufacturing Facility: Lexicon + Ion
